ESG Scop...

What's the differences between scope 1 ~ scope 3 for ESG?
Please answer me with English

Okay, here's a breakdown of Scope 1, 2, and 3 emissions within the context of ESG (Environmental, Social, and Governance), along with their key differences:

Understanding Greenhouse Gas (GHG) Emission Scopes

The concept of Scope 1, 2, and 3 emissions comes from the Greenhouse Gas Protocol, a widely used international accounting tool for understanding and managing GHG emissions. These scopes help organizations categorize and report their emissions to create transparency and accountability around their environmental impacts.

Scope 1: Direct Emissions

- **Definition:** These are direct GHG emissions that occur from sources that are owned or controlled by the reporting company. Think of it as the emissions caused *directly* by the company's operations.
- **Examples:**
 - Emissions from the combustion of fuel in company-owned or controlled boilers, furnaces, vehicles, etc.
